Creating your first Button

To get to your buttons overview page in the Usabilla back-end, click on **Setup** right underneath the **Buttons & Forms** menu. Here you will find an overview of all your created Feedback Buttons and Feedback Forms. If you haven't created any buttons yet, the page will be empty.

To create a new button, simply click the green **Create a new button** icon. In the next screen you will be able to give your button a name, and select the visual look of the button. There is a list of default buttons that you can choose from. If you want to have a customized button design, make sure to get in touch with your Customer Success Manager, or, upload your own design through the button editor on the top of the page.

Under the **Advanced Settings** tab, you have the option to enable a full page screenshots to be taken for every feedback item that is left on your website. If you are worried about accidentally capturing any of your users private information on a screenshot, simply disable the 'save form values' option. This will make sure that no open-text fields are registered when a screenshot is taken. Moreover, you can also make use of the Advance Privacy Settings if you wish to mask certain additional CSS elements on a page. More information on that can be found in [this](#) support article.

Finally, you can set-up **Auto labeling**. This is a functionality that detects keywords of your choice within the comment of a feedback item and gives the item a label based on that Keyword.

When you are all set and you want to save the button, click on the **Generate and install** button. Great! You have successfully created your first feedback button. You will automatically be redirected to the installation instructions page where you can find the Javascript snippet that is needed to install the feedback button on your website. For additional instruction on the installation process, please read the support articles shown underneath this video.
